**Abstract:** Let  $P(z) = \sum_{j=0}^n a_j z^j$  be a polynomial of degree  $n$ . Then according to Cauchy's classical result all the zeros of  $P(z)$  lie in  $|z| \leq 1 + A$ , where  $A = \max_{0 \leq j \leq n-1} \left| \frac{a_j}{a_n} \right|$ . The purpose of this paper is to present a ring-shaped region containing all or a specific number of zeros of  $P(z)$ .

## 1. INTRODUCTION

The following result known as Cauchy's Theorem [2] is well known in the theory of distribution of zeros of polynomials:

**Theorem A.** All the zeros of the polynomial  $P(z) = \sum_{j=0}^n a_j z^j$  of degree  $n$  lie in the circle  $|z| \leq 1 + M$ , where  $M = \max_{0 \leq j \leq n-1} \left| \frac{a_j}{a_n} \right|$ .

Several generalizations and improvements of this result are available in the literature. Mohammad [3] used Schwarz Lemma and proved the following result:

**Theorem B.** All the zeros of the polynomial  $P(z) = \sum_{j=0}^n a_j z^j$  of degree  $n$  lie in  $|z| \leq \frac{M}{|a_n|}$  if  $|a_n| \leq M$ , where  $M = \max_{|z|=1} |a_n z^{n-1} + \dots + a_0| = \max_{|z|=1} |a_0 z^{n-1} + \dots + a_{n-1}|$ .

In this paper, we find a ring-shaped region containing all the zeros of  $P(z)$ . We also obtain a result of similar nature for the number of zeros of the polynomial. In fact we prove the following results:

**Theorem 1.** All the zeros of the polynomial  $P(z) = \sum_{j=0}^n a_j z^j$  of degree  $n$  lie in the ring-shaped region  $r_1 \leq |z| \leq r_2$ , where

$$r_1 = \frac{[R^4 |a_1|^2 (M - |a_0|)^2 + 4|a_1|^2 R^2 M^3]^{\frac{1}{2}} - |a_1| R^2 (M - |a_0|)}{2M^2},$$

$$r_2 = \frac{2M_1^2}{[R^4 |a_{n-1}|^2 (M_1 - |a_n|)^2 + 4|a_n| R^2 M_1^3]^{\frac{1}{2}} - |a_{n-1}| R^2 (M_1 - |a_n|)},$$

$$M = \max_{|z|=R} |a_n z^n + \dots + a_1 z|,$$

$$M_1 = \max_{|z|=R} |a_0 z^n + \dots + a_{n-1} z|,$$

$R$  being any positive number.

**Theorem 2.** The number of zeros of the polynomial  $P(z) = \sum_{j=0}^n a_j z^j$  of degree  $n$  in the ring-shaped region  $r_1 \leq |z| \leq \frac{R}{c}$ ,  $1 < c \leq R$ , does not exceed

$$\frac{1}{\log c} \log\left(1 + \frac{M}{|a_0|}\right),$$

where  $M$  is as in Theorem 1.

## 2. LEMMAS

For the proofs of the above theorems we make use of the following results:

**Lemma 1.** Let  $f(z)$  be analytic in  $|z| \leq 1$ ,  $f(0)=a$ , where  $|a| < 1$ ,  $f'(0) = b$  and  $|f(z)| \leq 1$  for  $|z| = 1$ . Then, for  $|z| \leq 1$ ,

$$|f(z)| \leq \frac{(1-|a|)|z|^2 + |b||z| + |a|(1-|a|)}{|a|(1-|a|)|z|^2 + |b||z| + (1-|a|)}.$$

The example

$$f(z) = \frac{a + \frac{b}{1+a} z - z^2}{1 - \frac{b}{1+a} z - az^2}$$

shows that the estimate is sharp.

Lemma 1 is due to Govil, Rahman and Schmeisser [1].

**Lemma 2.** Let  $f(z)$  be analytic for  $|z| \leq R$ ,  $f(0)=0$ ,  $f'(0) = b$  and  $|f(z)| \leq M$  for  $|z| = R$ .

Then, for  $|z| \leq R$ ,

$$|f(z)| \leq \frac{M|z|}{R^2} \cdot \frac{M|z| + R^2|b|}{M + |b||z|}.$$

Lemma 2 is a simple deduction from Lemma 1.

**Lemma 3.** If  $f(z)$  is analytic for  $|z| \leq R$ ,  $f(0) \neq 0$  and  $|f(z)| \leq M$  for  $|z| = R$ , then the number of zeros of  $f(z)$  in  $|z| \leq \frac{R}{c}$ ,  $1 < c < R$  is less than or equal to  $\frac{1}{\log c} \log \frac{M}{|f(0)|}$ .

Lemma 3 is a simple deduction from Jensen's Theorem (see [4]).

**Proof of Theorem 1.** Let  $Q(z) = a_n z^n + a_{n-1} z^{n-1} + \dots + a_1 z$ .

Then  $Q(z)$  is analytic for  $|z| \leq R$ ,  $Q(0)=0$ ,  $Q'(0) = a_1$  and for  $|z| \leq R$

$$|Q(z)| = |a_n z^n + a_{n-1} z^{n-1} + \dots + a_1 z| \leq M$$

Hence, by Lemma 2, for  $|z| \leq R$ ,

$$|Q(z)| \leq \frac{M|z|}{R^2} \cdot \frac{M|z| + |a_1|R^2}{M + |a_1||z|}.$$

Therefore, for  $|z| \leq R$ ,

$$\begin{aligned} |P(z)| &= |Q(z) + a_0| \\ &\geq |a_0| - |Q(z)| \\ &\geq |a_0| - \frac{M|z|}{R^2} \cdot \frac{M|z| + |a_1|R^2}{M + |a_1||z|} \\ &> 0 \end{aligned}$$

if

$$|a_0|R^2(M + |a_1||z|) - M|z|(M|z| + |a_1|R^2) > 0$$

i.e. if  $M^2|z|^2 + |a_1|R^2(M - |a_0|)|z| - |a_0|R^2M < 0$

which is true if

Gulzar, MH  
Manzoor, AW

$$|z| < \frac{[R^4 |a_1|^2 (M - |a_0|)^2 + 4|a_0| R^2 M^3]^{\frac{1}{2}} - |a_1| R^2 (M - |a_0|)}{2M^2} .$$

Thus P(z) does not vanish in

$$|z| < \frac{[R^4 |a_1|^2 (M - |a_0|)^2 + 4|a_0| R^2 M^3]^{\frac{1}{2}} - |a_1| R^2 (M - |a_0|)}{2M^2} .$$

On the other hand, let

$$\begin{aligned} R(z) &= z^n P\left(\frac{1}{z}\right) = a_0 z^n + a_1 z^{n-1} + \dots + a_{n-1} z + a_n \\ &= H(z) + a_n , \end{aligned}$$

where

$$H(z) = a_0 z^n + a_1 z^{n-1} + \dots + a_{n-1} z .$$

Then H(z) is analytic and  $|H(z)| \leq M_1$  for  $|z| \leq R$  ,  $H(0)=0, H'(0) = a_{n-1}$  .

Hence, by Lemma 2, for  $|z| \leq R$  ,

$$|H(z)| \leq \frac{M_1 |z|}{R^2} \cdot \frac{M_1 |z| + |a_{n-1}| R^2}{M_1 + |a_{n-1}| |z|} .$$

Therefore, for  $|z| \leq R$  ,

$$\begin{aligned} |R(z)| &= |a_n + H(z)| \\ &\geq |a_n| - |H(z)| \\ &\geq |a_n| - \frac{M_1 |z|}{R^2} \cdot \frac{M_1 |z| + |a_{n-1}| R^2}{M_1 + |a_{n-1}| |z|} \\ &> 0 \end{aligned}$$

if

$$|a_n| R^2 (M_1 + |a_{n-1}| |z|) - M_1 |z| (M_1 |z| + |a_{n-1}| R^2) > 0$$

i.e. if

$$M_1^2 |z|^2 + |a_{n-1}| R^2 (M_1 - |a_n|) |z| - |a_n| R^2 M_1 < 0$$

which is true if

---

$$|z| < \frac{[R^4 |a_{n-1}|^2 (M_1 - |a_n|)^2 + 4|a_n| R^2 M_1^3]^{\frac{1}{2}} - |a_{n-1}| R^2 (M_1 - |a_n|)}{2M_1^2}.$$

A Ring-shaped  
Region for  
the Zeros of a  
Polynomial

Thus P(z) does not vanish in

$$|z| < \frac{[R^4 |a_{n-1}|^2 (M_1 - |a_n|)^2 + 4|a_n| R^2 M_1^3]^{\frac{1}{2}} - |a_{n-1}| R^2 (M_1 - |a_n|)}{2M_1^2}.$$

Hence all the zeros of R(z) lie in

$$|z| \geq \frac{[R^4 |a_{n-1}|^2 (M_1 - |a_n|)^2 + 4|a_n| R^2 M_1^3]^{\frac{1}{2}} - |a_{n-1}| R^2 (M_1 - |a_n|)}{2M_1^2}.$$

Thus all the zeros of  $z^n P\left(\frac{1}{z}\right)$  lie in

$$|z| \geq \frac{[R^4 |a_{n-1}|^2 (M_1 - |a_n|)^2 + 4|a_n| R^2 M_1^3]^{\frac{1}{2}} - |a_{n-1}| R^2 (M_1 - |a_n|)}{2M_1^2}.$$

Hence all the zeros of  $P\left(\frac{1}{z}\right)$  lie in

$$|z| \geq \frac{[R^4 |a_{n-1}|^2 (M_1 - |a_n|)^2 + 4|a_n| R^2 M_1^3]^{\frac{1}{2}} - |a_{n-1}| R^2 (M_1 - |a_n|)}{2M_1^2}.$$

This implies that all the zeros of P(z) lie in

$$|z| \leq \frac{2M_1^2}{[R^4 |a_{n-1}|^2 (M_1 - |a_n|)^2 + 4|a_n| R^2 M_1^3]^{\frac{1}{2}} - |a_{n-1}| R^2 (M_1 - |a_n|)}.$$

Consequently, it follows that all the zeros of P(z) lie in the ring-shaped region  $r_1 \leq |z| \leq r_2$  and the proof of Theorem 1 is complete.

**Proof of Theorem 2.** To prove Theorem 2, we need to show only that the number of zeros of P(z) in  $|z| \leq \frac{R}{c}, 1 < c < R$  does not exceed  $\frac{1}{\log c} \log\left(1 + \frac{M}{|a_0|}\right)$ . Since P(z) is analytic for  $|z| \leq R$ ,  $P(0) = a_0$  and for  $|z| \leq \frac{R}{c}$ ,

$$|P(z)| = |a_n z^n + a_{n-1} z^{n-1} + \dots + a_1 z + a_0|$$

---

---

Gulzar, MH  
Manzoor, AW

$$\leq |a_n z^n + a_{n-1} z^{n-1} + \dots + a_1 z| + |a_0|$$
$$\leq M + |a_0|,$$

it follows, by Lemma 3, that the number of zeros of  $P(z)$  in  $|z| \leq \frac{R}{c}, 1 < c \leq R$

does not exceed  $\frac{1}{\log c} \log \frac{M + |a_0|}{|a_0|} = \frac{1}{\log c} \log(1 + \frac{M}{|a_0|})$  and Theorem 2 follows.
